Chapter 1

Main Page

Gnowee

Version

1.0

[Gnowee](#) is a general nearly-global metaheuristic optimization algorithm. It uses a blend of common heuristics to solve difficult gradient free constrained MINLP problems with mixed variables. It is capable of solving simpler problems, but may not be the algorithm of choice.

Running [Gnowee](#)

For examples on how to run [Gnowee](#), please refer to the runGnowee notebook included in the src directory.

Building Documentation

To build the documentation, in the docs/src directory run the command:

```
>> doxygen Doxyfile
```

This will build the html and latex version of the documentation. The symlink in the docs directory for the html index should automatically update. T

The up-to-date latex documentation is included in a pdf form in the repo under the docs directory. If an update of the latex documentation is desired, go to the docs/latex directory and run the command:

```
>> make
```

This will build the latex documentation. The file will be named refman.pdf and be placed in this directory.

Module Index

2.1 Modules

Here is a list of all modules:

Constraints	13
Gnowee	14
GnoweeHeuristics	15
GnoweeUtilities	17
ObjectiveFunction	18
OptiPlot	19
Sampling	22

Chapter 3

Namespace Index

3.1 Packages

Here are the packages with brief descriptions (if available):

Gnowee	Contains the Gnowee optimization program and associated utilities	27
------------------------	---	--------------------

Chapter 4

Hierarchical Index

4.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

object	
Constraints.Constraint	29
GnoweeUtilities.Event	36
GnoweeUtilities.Parent	61
GnoweeUtilities.ProblemParameters	63
GnoweeHeuristics.GnoweeHeuristics	38
GnoweeUtilities.Switch	68
ObjectiveFunction.ObjectiveFunction	48
Sampling.WeightedRandomGenerator	69

Chapter 5

Class Index

5.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Constraints.Constraint	
The class creates a Constraints object that can be used in optimization algorithms	29
GnoweeUtilities.Event	
Represents a snapshot in the optimization process to be used for debugging, benchmarking, and user feedback	36
GnoweeHeuristics.GnoweeHeuristics	
The class is the foundation of the Gnowee optimization algorithm	38
ObjectiveFunction.ObjectiveFunction	
The class creates a ObjectiveFunction object that can be used in optimization algorithms . . .	48
GnoweeUtilities.Parent	
The class contains all of the parameters pertinent to a member of the population	61
GnoweeUtilities.ProblemParameters	
Creates an object containing key features of the chosen optimization problem	63
GnoweeUtilities.Switch	
Creates a switch class object to switch between cases	68
Sampling.WeightedRandomGenerator	
Defines a class of weights to be used to select based on linear weighting	69

Chapter 6

File Index

6.1 File List

Here is a list of all documented files with brief descriptions:

/home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/ Constraints.py	73
/home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/ Gnowee.py	73

Chapter 7

Module Documentation

7.1 Constraints

Defines a class to perform constraint calculations.

Classes

- class [Constraints.Constraint](#)

The class creates a Constraints object that can be used in optimization algorithms.

7.1.1 Detailed Description

Defines a class to perform constraint calculations.

Author

James Bevins,

Date

12May17

7.2 Gnowee

Main program for the [Gnowee](#) metaheuristic algorithm.

Functions

- `def Gnowee.main`
Main controller program for the [Gnowee](#) optimization.

7.2.1 Detailed Description

Main program for the [Gnowee](#) metaheuristic algorithm. General nearly-global metaheuristic optimization algorithm. Uses a blend of common heuristics to solve difficult gradient free constrained MINLP problems with categorical variables. It is capable of solving simpler problems, but may not be the algorithm of choice.

For examples on how to run [Gnowee](#), please refer to the `runGnowee` notebook included in the `src` directory.

Author

James Bevins

Date

11May17

7.2.2 Function Documentation

7.2.2.1 `def Gnowee.main (gh)`

Main controller program for the [Gnowee](#) optimization.

Parameters

<i>gh</i>	<i>GnoweeHeuristic object</i> An object constaining the problem definition and the settings and methods required for the Gnowee optimization algorithm.
-----------	--

Returns

list: List for design event objects for the current top solution vs generation. Only stores the information when new optimal designs are found.

7.3 GnoweeHeuristics

Heuristics and settings supporting the [Gnowee](#) metaheuristic optimization algorithm.

Classes

- class [GnoweeHeuristics.GnoweeHeuristics](#)
The class is the foundation of the [Gnowee](#) optimization algorithm.

Functions

- def [GnoweeHeuristics.simple_bounds](#)
Application of problem boundaries to generated solutions.
- def [GnoweeHeuristics.rejection_bounds](#)
Application of problem boundaries to generated solutions.

7.3.1 Detailed Description

Heuristics and settings supporting the [Gnowee](#) metaheuristic optimization algorithm. This instantiates the class and methods necessary to perform an optimization using the [Gnowee](#) algorithm. Each of the heuristics can also be used independently of the [Gnowee](#) algorithm by instantiating this class and choosing the desired heuristic.

The default settings are those found to be best for a suite of benchmark problems but one may find alternative settings are useful for the problem of interest based on the fitness landscape and type of variables.

Author

James Bevins

Date

11May17

7.3.2 Function Documentation

7.3.2.1 def GnoweeHeuristics.rejection_bounds (parent, child, stepSize, lb, ub)

Application of problem boundaries to generated solutions.

Adjusts step size for all rejected solutions until within the boundaries.

Parameters

<i>parent</i>	<i>array</i> The current system designs.
<i>child</i>	<i>array</i> The proposed new system designs.
<i>stepSize</i>	<i>float</i> The stepsize for the permutation.

<i>lb</i>	<i>array</i> The lower bounds of the design variable(s).
<i>ub</i>	<i>array</i> The upper bounds of the design variable(s).

Returns

array: The new system design that is within problem boundaries.

7.3.2.2 `def GnoweeHeuristics.simple_bounds (child, lb, ub)`

Application of problem boundaries to generated solutions.

If outside of the boundaries, the variable defaults to the boundary.

Parameters

<i>child</i>	<i>array</i> The proposed new system designs.
<i>lb</i>	<i>array</i> The lower bounds of the design variable(s).
<i>ub</i>	<i>array</i> The upper bounds of the design variable(s).

Returns

array: The new system design that is within problem boundaries.

7.4 GnoweeUtilities

Classes and methods to support the [Gnowee](#) optimization algorithm.

Classes

- class [GnoweeUtilities.Parent](#)
The class contains all of the parameters pertinent to a member of the population.
- class [GnoweeUtilities.Event](#)
Represents a snapshot in the optimization process to be used for debugging, benchmarking, and user feedback.
- class [GnoweeUtilities.ProblemParameters](#)
Creates an object containing key features of the chosen optimization problem.
- class [GnoweeUtilities.Switch](#)
Creates a switch class object to switch between cases.

Functions

- def [GnoweeUtilities.Switch.__init__](#)
Creates a switch class object to switch between cases.

7.4.1 Detailed Description

Classes and methods to support the [Gnowee](#) optimization algorithm.

Author

James Bevins

Date

12May17

7.4.2 Function Documentation

7.4.2.1 def GnoweeUtilities.Switch.__init__(self, value)

Creates a switch class object to switch between cases.

Case constructor.

Parameters

<i>self</i>	<i>pointer</i> The Switch pointer.
<i>value</i>	<i>string</i> Case selector value.

7.5 ObjectiveFunction

Defines a class to perform objective function calculations.

Classes

- class [ObjectiveFunction.ObjectiveFunction](#)

The class creates a [ObjectiveFunction](#) object that can be used in optimization algorithms.

Functions

- def [ObjectiveFunction.prod](#)

Computes the product of a set of numbers (ie big PI, multiplicative equivalent to sum).

7.5.1 Detailed Description

Defines a class to perform objective function calculations. This class contains the necessary functions and methods to create objective functions and initialize the necessary parameters. The class is pre-stocked with common benchmark functions for easy fishing.

Users can modify the this class to add additional functions following the format of the functions currently in the class.

Author

James Bevins

Date

12May17

7.5.2 Function Documentation

7.5.2.1 def ObjectiveFunction.prod (*iterable*)

Computes the product of a set of numbers (ie big PI, multiplicative equivalent to sum).

Parameters

<i>iterable</i>	<i>list or array or generator</i>	Iterable set to multiply.
-----------------	-----------------------------------	---------------------------

Returns

float: The product of all of the items in iterable

7.6 OptiPlot

Plotting functions developed to help visualize and quantify the metaheuristic optimization process.

Functions

- def [OptiPlot.plot_vars](#)
Plot the variables as they change in the optimization process.
- def [OptiPlot.plot_hist](#)
Plots the histogram of function evaluation results from multiple runs of an optimization algorithm.
- def [OptiPlot.plot_hist_comp](#)
Histograms and plots the comparison of two sets of function evaluation data.
- def [OptiPlot.plot_feval_hist](#)
Plots the fitness vs function evaluation results of an optimization algorithm run.
- def [OptiPlot.plot_tlf](#)
Plots a comparison of the TLF to the Levy distribution.
- def [OptiPlot.plot_optimization](#)
Plots the results of optimization process for a given algorithm and parameter.

7.6.1 Detailed Description

Plotting functions developed to help visualize and quantify the metaheuristic optimization process.

Author

James Bevins

Date

10May17

7.6.2 Function Documentation

7.6.2.1 `def OptiPlot.plot_feval_hist(data = [], listData = [], label = [])`

Plots the fitness vs function evaluation results of an optimization algorithm run.

Can plot a single run or multiple to compare results. To plot multiple data sets, use the listData argument; otherwise, use the data argument.

Parameters

<i>data</i>	<i>list or array</i> Contains the function eval history. Columns are: [function evals, fitness, number of datapoints].
<i>listData</i>	<i>list of lists or arrays</i> Contains a list of function eval histories. Columns are: [function evals, fitness, number of datapoints].

<i>label</i>	<i>list</i> List of names corresponding to the data sets provided.
--------------	---

7.6.2.2 `def OptiPlot.plot_hist (data, title = "", xLabel = "")`

Plots the histogram of function evaluation results from multiple runs of an optimization algorithm.

Can be used to understand the convergence of the algorithm.

Parameters

<i>data</i>	<i>list</i> Contains the number of function evals for each optimization run.
<i>title</i>	<i>string</i> Title for plot.
<i>xLabel</i>	<i>string</i> Label for independent variable.

7.6.2.3 `def OptiPlot.plot_hist_comp (data, data2, dataLabels, title = "", xLabel = "")`

Histograms and plots the comparison of two sets of function evaluation data.

Parameters

<i>data</i>	<i>list</i> Contains the number of function evals for each optimization run.
<i>data2</i>	<i>list</i> Contains the number of function evals for each optimization run for a second set of runs.
<i>dataLabels</i>	<i>list</i> Contains the legend label names for each data set.
<i>title</i>	<i>string</i> Title for plot.
<i>xLabel</i>	<i>string</i> Label for independent variable.

7.6.2.4 `def OptiPlot.plot_optimization (data, label, title = "")`

Plots the results of optimization process for a given algorithm and parameter.

Parameters

<i>data</i>	<i>array</i> Contains the function eval history. Columns are: [function evals, fitness, number of datapoints]
-------------	--

<i>label</i>	<i>list</i> List of names of the problem types ran.
<i>title</i>	<i>string</i> Title for plot.

7.6.2.5 `def OptiPlot.plot_tlf (alpha = 1.5, gamma = 1., numSamp = 1E7, cutPoint = 10.)`

Plots a comparison of the TLF to the Levy distribution.

Parameters

<i>alpha</i>	<i>float</i> Levy exponent - defines the index of the distribution and controls scale properties of the stochastic process.
<i>gamma</i>	<i>float</i> Gamma - Scale unit of process for Levy flights.
<i>numSamp</i>	<i>integer</i> Number of Levy flights to sample.
<i>cutPoint</i>	<i>float</i> Point at which to cut sampled Levy values and resample.

7.6.2.6 `def OptiPlot.plot_vars (data, lowBounds = [], upBounds = [], title = [], label = [])`

Plot the variables as they change in the optimization process.

Currently only functions in post-processing, not real time.

Parameters

<i>data</i>	<i>list of event objects</i> Contain the optimization history in event objects within the data list.
<i>lowBounds</i>	<i>array</i> The lower bounds of the design variable(s).
<i>upBounds</i>	<i>array</i> The upper bounds of the design variable(s).
<i>title</i>	<i>string</i> Title for plot.
<i>label</i>	<i>list</i> List of names of design variables.

7.7 Sampling

Different methods to perform phase space sampling and random walks.

Classes

- class [Sampling.WeightedRandomGenerator](#)
Defines a class of weights to be used to select based on linear weighting.

Functions

- def [Sampling.initial_samples](#)
Generate a set of samples in a given phase space.
- def [Sampling.plot_samples](#)
Plot the first 2 and 3 dimensions on the sample distribution.
- def [Sampling.levy](#)
Sample the Levy distribution given by.
- def [Sampling.tlf](#)
Samples from a truncated Levy flight distribution (TLF) according to Manegna, "Stochastic Process with Ultraslow Convergence to a Gaussian: The Truncated Levy Flight" to map a levy distribution onto the interval [0,1].
- def [Sampling.NOLH](#)
This library allows to generate Nearly Orthogonal Latin Hypercubes (NOLH) according to Cioppa (2007) and De Rainville et al.
- def [Sampling.params](#)
Returns the NOLH order m , the required configuration length q and the number of columns to remove to obtain the desired dimensionality.
- def [Sampling.get_cdr_permutations](#)
Generate a set of CDR permutations for NOLH.

7.7.1 Detailed Description

Different methods to perform phase space sampling and random walks. Design of experiment and phase space sampling methods. Includes some vizualization tools.

Dependencies on pyDOE.

Author

James Bevins

Date

12May17

7.7.2 Function Documentation

7.7.2.1 def Sampling.get_cdr_permutations (dim)

Generate a set of CDR permutations for NOLH.

Parameters

<i>dim</i>	<i>integer</i> The dimension of the space.
------------	---

Returns

array: A configuration vector.

array: Array containing the indexes of the columns to be removed from conf vector.

7.7.2.2 def Sampling.initial_samples (*lb*, *ub*, *method*, *numSamp*)

Generate a set of samples in a given phase space.

The current methods available are 'random', 'nolh', 'nolh-rp', 'nolh-cdr', or 'lhc'.

Parameters

<i>lb</i>	<i>array</i> The lower bounds of the design variable(s).
<i>ub</i>	<i>array</i> The upper bounds of the design variable(s).
<i>method</i>	<i>string</i> String representing the chosen sampling method. Valid options are: 'random', 'nolh', 'nolh-rp', 'nolh-cdr', or 'lhc'.
<i>numSamp</i>	<i>integer</i> The number of samples to be generated. Ignored for nolh algorithms.

Returns

array: The list of coordinates for the sampled phase space.

7.7.2.3 def Sampling.levy (*nc*, *nr* = 0, *alpha* = 1.5, *gam* = 1, *n* = 1)

Sample the Levy distribution given by.

$$L_{\alpha,\gamma}(z) = \frac{1}{\pi} \int_0^{+\infty} e^{-\gamma q^\alpha} \cos(qz) dq$$

using the Mantegna algorithm outlined in "Fast, Accurate Algorithm for Numerical Simulation of Levy Stable Stochastic Processes."

Parameters

<i>nc</i>	<i>integer</i> The number of columns of Levy values for the return array.
<i>nr</i>	<i>integer</i> The number of rows of Levy values for the return array.

<i>alpha</i>	<i>float</i> Levy exponent - defines the index of the distribution and controls scale properties of the stochastic process.
<i>gam</i>	<i>float</i> Gamma - Scale unit of process for Levy flights.
<i>n</i>	<i>integer</i> Number of independent variables - can be used to reduce Levy flight sampling variance.

Returns

array: Array representing the levy flights for each nest.

7.7.2.4 def Sampling.NOLH (*conf*, *remove* = None)

This library allows to generate Nearly Orthogonal Latin Hypercubes (NOLH) according to Cioppa (2007) and De Rainville et al.

(2012) and reference therein.

<https://pypi.python.org/pypi/pynolh>

Constructs a Nearly Orthogonal Latin Hypercube (NOLH) of order m from a configuration vector *conf*. The configuration vector may contain either the numbers in $[0, q-1]$ or $[1, q]$ where $q = 2^{m-1}$. The columns to be removed are also in $[0, d-1]$ or $[1, d]$ where

$d = m + \{m-1\}_2$

is the NOLH dimensionality.

The whole library is incorporated here with minimal modification for commonality and consolidation of methods.

Parameters

<i>conf</i>	<i>array</i> Configuration vector.
<i>remove</i>	<i>array</i> Array containing the indexes of the columns to be removed from conf vector.

Returns

array: Array containing nearly orthogonal latin hypercube sampling.

7.7.2.5 def Sampling.params (*dim*)

Returns the NOLH order m , the required configuration length q and the number of columns to remove to obtain the desired dimensionality.

Parameters

<i>dim</i>	<i>integer</i> The dimension of the space.
------------	---

7.7.2.6 `def Sampling.plot_samples (s)`

Plot the first 2 and 3 dimensions on the sample distribution.

Can't plot the full hyperspace yet. Produces a very simple plot for visualizing the difference in the sampling methods.

Parameters

<i>s</i>	<i>array</i> The list of coordinates for the sampled phase space.
----------	--

7.7.2.7 `def Sampling.tlf (numRows = 1, numCol = 1, alpha = 1.5, gam = 1., cutPoint = 10.)`

Samples from a truncated Levy flight distribution (TLF) according to Manegna, "Stochastic Process with Ultraslow Convergence to a Gaussian: The Truncated Levy Flight" to map a levy distribution onto the interval [0,1].

Parameters

<i>numRow</i>	<i>integer</i> Number of rows of Levy flights to sample.
<i>numCol</i>	<i>integer</i> Number of columns of Levy flights to sample.
<i>alpha</i>	<i>float</i> Levy exponent - defines the index of the distribution and controls scale properties of the stochastic process.
<i>gam</i>	<i>float</i> Gamma - Scale unit of process for Levy flights.
<i>cutPoint</i>	<i>float</i> Point at which to cut sampled Levy values and resample.

Returns

array: Array representing the levy flights on the interval (0,1).

Chapter 8

Namespace Documentation

8.1 Gnowee Namespace Reference

Contains the [Gnowee](#) optimization program and associated utilities.

Functions

- `def main`
Main controller program for the [Gnowee](#) optimization.

8.1.1 Detailed Description

Contains the [Gnowee](#) optimization program and associated utilities.

Version

1.0

General nearly-global metaheuristic optimization algorithm. Uses a blend of common heuristics to solve difficult gradient free constrained MINLP problems with categorical variables. It is capable of solving simpler problems, but may not be the algorithm of choice.

For examples on how to run [Gnowee](#), please refer to the runGnowee notebook included in the src directory.

Class Documentation

9.1 Constraints.Constraint Class Reference

The class creates a Constraints object that can be used in optimization algorithms.

Inheritance diagram for Constraints.Constraint:

Public Member Functions

- `def __init__`
Constructor to build the ObjectiveFunction class.
- `def __repr__`
Constraint class param print function.
- `def __str__`
Human readable Constraint print function.
- `def set_constraint_func`
Converts an input string name for a function to a function handle.
- `def get_penalty`
Calculate the constraint violation penalty, if any.
- `def spring`
Spring penalty method of constraint enforcement.
- `def mi_spring`
Spring penalty method of constraint enforcement.
- `def welded_beam`
Welded Beam penalty method of constraint enforcement.
- `def pressure_vessel`
Pressure vessel penalty method of constraint enforcement.
- `def mi_pressure_vessel`
Mixed Integer Pressure vessel penalty method of constraint enforcement.
- `def speed_reducer`
Speed reducer penalty method of constraint enforcement.
- `def mi_chemical_process`

Chemical process design constraint enforcement.

- `def less_or_equal`
Compares a previously calculated value to a user specified maximum including that maximum.
- `def less_than`
Compares a previously calculated value to a user specified maximum excluding that maximum.
- `def greater_than`
Compares the calculated value to the minimum specified by the user.

Public Attributes

- `func`
function handle: The function handle for the constraint function to be used for the optimization.
- `constraint`
float: The constraint to be enforced.
- `penalty`
float: The penalty to be applied if the constraint is violated

9.1.1 Detailed Description

The class creates a Constraints object that can be used in optimization algorithms.

9.1.2 Constructor & Destructor Documentation

9.1.2.1 `def Constraints.Constraint.__init__(self, method = None, constraint = None, penalty = 1E15)`

Constructor to build the ObjectiveFunction class.

Parameters

<i>self</i>	<i>object pointer</i> The object pointer.
<i>method</i>	<i>string</i> The name of the constraint function to evaluate.
<i>constraint</i>	<i>float</i> The constraint to be compared against.
<i>penalty</i>	<i>float</i> The penalty to be applied if a constraint is violated. 1E15 is recommended.

9.1.3 Member Function Documentation

9.1.3.1 `def Constraints.Constraint.__repr__(self)`

`Constraint` class param print function.

Parameters

<i>self</i>	<i>pointer</i> The Constraint pointer.
-------------	---

9.1.3.2 def Constraints.Constraint.__str__(self)

Human readable [Constraint](#) print function.

Parameters

<i>self</i>	<i>pointer</i> The Constraint pointer.
-------------	---

9.1.3.3 def Constraints.Constraint.get_penalty(self, violation)

Calculate the constraint violation penalty, if any.

Parameters

<i>self</i>	<i>pointer</i> The Constraint pointer.
<i>violation</i>	<i>float</i> The magnitude of the constraint violation used for scaling the penalty.

Returns

float: The scaled penalty.

9.1.3.4 def Constraints.Constraint.greater_than(self, candidate)

Compares the calculated value to the minimum specified by the user.

Parameters

<i>self</i>	<i>pointer</i> The Constraint pointer.
<i>candidate</i>	<i>float</i> The calculated value corresponding to a candidate design.

Returns

float: The penalty associated with the candidate design.

9.1.3.5 def Constraints.Constraint.less_or_equal(self, candidate)

Compares a previously calculated value to a user specified maximum including that maximum.

Parameters

<i>self</i>	<i>pointer</i> The Constraint pointer.
<i>candidate</i>	<i>float</i> The calculated value corresponding to a candidate design.

Returns

float: The penalty associated with the candidate design.

9.1.3.6 `def Constraints.Constraint.less_than (self, candidate)`

Compares a previously calculated value to a user specified maximum excluding that maximum.

Parameters

<i>self</i>	<i>pointer</i> The Constraint pointer.
<i>candidate</i>	<i>float</i> The calculated value corresponding to a candidate design.

Returns

float: The penalty associated with the candidate design.

9.1.3.7 `def Constraints.Constraint.mi_chemical_process (self, u)`

Chemical process design constraint enforcement.

Optimal example:

$u = [(0.2, 0.8, 1.907878, 1, 1, 0, 1)]$

fitness = 4.579582

Taken from: "An Improved PSO Algorithm for Solving Non-convex NLP/MINLP Problems with Equality Constraints"

Parameters

<i>self</i>	<i>pointer</i> The <code>ObjectiveFunction</code> pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated. [x1, x2, x3, y1, y2, y3, y4]

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.1.3.8 `def Constraints.Constraint.mi_pressure_vessel (self, u)`

Mixed Integer Pressure vessel penalty method of constraint enforcement.

Near optimal example:

$u = [58.2298, 44.0291, 17, 9]$

fitness = 7203.24

Optimal example obtained with [Gnowee](#):

$u = [38.819876, 221.985576, 0.750000, 0.375000]$

fitness = 5855.893191

Taken from: "Nonlinear Integer and Discrete Programming in Mechanical Design Optimization"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.1.3.9 def Constraints.Constraint.mi_spring (self, u)

Spring penalty method of constraint enforcement.

Optimal Example:

$u = [1.22304104, 9, 36] = [1.22304104, 9, 0.307]$

fitness = 2.65856

Taken from Lampinen, "Mixed Integer-Discrete-Continuous Optimization by Differential Evolution"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

float: The assessed penalty for constraint violations for the specified input.

9.1.3.10 def Constraints.Constraint.pressure_vessel (self, u)

Pressure vessel penalty method of constraint enforcement.

Near Optimal Example:

$u = [0.81250000001, 0.4375, 42.098445595854923, 176.6365958424394]$

fitness = 6059.714335

Optimal obtained using [Gnowee](#):

`u = [0.7781686880924992, 0.3846491857203429, 40.319621144688995, 199.99996630362293]`

`fitness = 5885.33285347`

Taken from: "Solving Engineering Optimization Problems with the Simple Constrained Particle Swarm Optimizer"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.1.3.11 `def Constraints.Constraint.set_constraint_func (self, funcName)`

Converts an input string name for a function to a function handle.

Parameters

<i>self</i>	<i>pointer</i> The Constraint pointer.
<i>funcName</i>	<i>string</i> A string identifying the constraint function to be used.

9.1.3.12 `def Constraints.Constraint.speed_reducer (self, u)`

Speed reducer penalty method of constraint enforcement.

Optimal example:

`u = [58.2298, 44.0291, 17, 9]`

`fitness = 2996.34784914`

Optimal example obtained with [Gnowee](#):

`u = [3.500000, 0.7, 17, 7.300000, 7.800000, 3.350214, 5.286683]`

`fitness = 5855.893191`

Taken from: "Solving Engineering Optimization Problems with the Simple Constrained Particle Swarm Optimizer"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
-------------	--

<i>u</i>	<i>array</i> The design parameters to be evaluated.
----------	--

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.1.3.13 def Constraints.Constraint.spring (self, u)

Spring penalty method of constraint enforcement.

Optimal Example:

u = [0.05169046, 0.356750, 11.287126]

fitness = 0.0126653101469

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.1.3.14 def Constraints.Constraint.welded_beam (self, u)

Welded Beam penalty method of constraint enforcement.

Optimal Example:

u = [0.20572965, 3.47048857, 9.0366249, 0.20572965]

fitness = 1.7248525603892848

Taken from: "Solving Engineering Optimization Problems with the Simple Constrained Particle Swarm Optimizer"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.1.4 Member Data Documentation

9.1.4.1 Constraints.Constraint.constraint

float: The constraint to be enforced.

9.1.4.2 Constraints.Constraint.func

function handle: The function handle for the constraint function to be used for the optimization.

The function must be specified as a method of the class.

The documentation for this class was generated from the following file:

- </home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/Constraints.py>

9.2 GnoweeUtilities.Event Class Reference

Represents a snapshot in the optimization process to be used for debugging, benchmarking, and user feedback.

Inheritance diagram for GnoweeUtilities.Event:

Public Member Functions

- `def __init__`
Constructor to build the [Event](#) class.
- `def __repr__`
[Event](#) print function.
- `def __str__`
Human readable [Event](#) print function.

Public Attributes

- `generation`
integer: The generation the design was arrived at.
- `evaluations`
integer: The number of fitness evaluations done to obtain this design.
- `fitness`
float: The assessed fitness for the current set of variables.
- `design`
array: The set of variables representing a design solution.

9.2.1 Detailed Description

Represents a snapshot in the optimization process to be used for debugging, benchmarking, and user feedback.

9.2.2 Constructor & Destructor Documentation

9.2.2.1 `def GnoweeUtilities.Event.__init__(self, generation, evaluations, fitness, design)`

Constructor to build the [Event](#) class.

Parameters

<i>self</i>	Event pointer The Event pointer.
<i>generation</i>	<i>integer</i> The generation the design was arrived at.
<i>evaluations</i>	<i>integer</i> The number of fitness evaluations done to obtain this design.
<i>fitness</i>	<i>float</i> The assessed fitness for the current set of variables.
<i>design</i>	<i>array</i> The set of variables representing a design solution.

9.2.3 Member Function Documentation

9.2.3.1 `def GnoweeUtilities.Event.__repr__(self)`

[Event](#) print function.

Parameters

<i>self</i>	Event pointer The Event pointer.
-------------	---

9.2.3.2 `def GnoweeUtilities.Event.__str__(self)`

Human readable [Event](#) print function.

Parameters

<i>self</i>	Event pointer The Event pointer.
-------------	---

9.2.4 Member Data Documentation

9.2.4.1 `GnoweeUtilities.Event.design`

array: The set of variables representing a design solution.

9.2.4.2 `GnoweeUtilities.Event.evaluations`

integer: The number of fitness evaluations done to obtain this design.

9.2.4.3 GnoweeUtilities.Event.fitness

float: The assessed fitness for the current set of variables.

9.2.4.4 GnoweeUtilities.Event.generation

integer: The generation the design was arrived at.

The documentation for this class was generated from the following file:

- /home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/[GnoweeUtilities.py](#)

9.3 GnoweeHeuristics.GnoweeHeuristics Class Reference

The class is the foundation of the [Gnowee](#) optimization algorithm.

Inheritance diagram for GnoweeHeuristics.GnoweeHeuristics:

Public Member Functions

- def [__init__](#)
Constructor to build the [GnoweeHeuristics](#) class.
- def [__repr__](#)
[GnoweeHeuristics](#) print function.
- def [__str__](#)
Human readable [GnoweeHeuristics](#) print function.
- def [initialize](#)
Initialize the population according to the sampling method chosen.
- def [disc_levy_flight](#)
Generate new children using truncated Levy flights permutation of current generation design parameters according to:
- def [cont_levy_flight](#)
Generate new children using Levy flights permutation of current generation design parameters according to:
- def [scatter_search](#)
Generate new designs using the scatter search heuristic according to:
- def [elite_crossover](#)
Generate new designs by using inver-over on combinatorial variables.
- def [crossover](#)
Generate new children using distance based crossover strategies on the top parent.
- def [mutate](#)
Generate new children by adding a weighted difference between two population vectors to a third vector.
- def [population_update](#)
Calculate fitness, apply constraints, if present, and update the population if the children are better than their parents.

Public Attributes

- [population](#)
integer: The number of members in each generation.
- [initSampling](#)
string: The method used to sample the phase space and create the initial population.
- [fracDiscovered](#)
float: Discovery probability used for the [mutate\(\)](#) heuristic.
- [fracElite](#)
float: Elite fraction probability used for the [scatter_search\(\)](#), [crossover\(\)](#), and [cont_crossover\(\)](#) heuristics.
- [fracLevy](#)
float: Levy flight probability used for the [disc_levy_flight\(\)](#) and [cont_levy_flight\(\)](#) heuristics.
- [alpha](#)
float: Levy exponent - defines the index of the distribution and controls scale properties of the stochastic process.
- [gamma](#)
float: Gamma - scale unit of process for Levy flights.
- [n](#)
integer: Number of independent variables - can be used to reduce Levy flight sampling variance.
- [scalingFactor](#)
float: Step size scaling factor used to adjust Levy flights to length scale of system.
- [penalty](#)
float: Individual constraint violation penalty to add to objective function.
- [maxGens](#)
integer: The maximum number of generations to search.
- [maxFevals](#)
integer: The maximum number of objective function evaluations.
- [convTol](#)
float: The minimum change of the best objective value before the search terminates.
- [stallLimit](#)
integer: The maximum number of generations to search without a decrease exceeding convTol.
- [optConvTol](#)
float: The maximum deviation from the best know fitness value before the search terminates.

9.3.1 Detailed Description

The class is the foundation of the [Gnowee](#) optimization algorithm.

It sets the settings required for the algorithm and defines the heuristics.

9.3.2 Constructor & Destructor Documentation

9.3.2.1 `def GnoweeHeuristics.GnoweeHeuristics.__init__(self, population = 25, initSampling = 'lhc', fracDiscovered = 0.2, fracElite = 0.2, fracLevy = 0.2, alpha = 1.5, gamma = 1, n = 1, scalingFactor = 10.0, penalty = 0.0, maxGens = 20000, maxFevals = 200000, convTol = 1e-6, stallLimit = 225, optConvTol = 1e-2, kwargs)`

Constructor to build the [GnoweeHeuristics](#) class.

This class must be fully instantiated to run the [Gnowee](#) program. It consists of 2 main parts: The main class attributes and the inherited ProblemParams class attributes. The main class attributes contain defaults that don't require direct user input to work (but can be modified by user input if desired), but the ProblemParameter class does require proper instantiation by the user.

The default settings are found to be optimized for a wide range of problems, but can be changed to optimize performance for a particular problem type or class. For more details, refer to the benchmark code in the development branch of the repo or [<insert link="" to="" paper="">](#).

Parameters

<i>self</i>	<i>GnoweeHeuristic pointer</i> The GnoweeHeuristics pointer.
<i>population</i>	<i>integer</i> The number of members in each generation.
<i>initSampling</i>	<i>string</i> The method used to sample the phase space and create the initial population. Valid options are 'random', 'nolh', 'nolh-rp', 'nolh-cdr', and 'lhc' as specified in <code>init_samples()</code> .
<i>fracDiscovered</i>	<i>: float</i> Discovery probability used for the mutate() heuristic.
<i>fracElite</i>	<i>float</i> Elite fraction probability used for the scatter_search() , crossover() , and <code>cont_crossover()</code> heuristics.
<i>fracLevy</i>	<i>float</i> Levy flight probability used for the disc_levy_flight() and cont_levy_flight() heuristics.
<i>alpha</i>	<i>float</i> Levy exponent - defines the index of the distribution and controls scale properties of the stochastic process.
<i>gamma</i>	<i>float</i> Gamma - scale unit of process for Levy flights.
<i>n</i>	<i>integer</i> Number of independent variables - can be used to reduce Levy flight sampling variance.
<i>penalty</i>	<i>float</i> Individual constraint violation penalty to add to objective function.
<i>scalingFactor</i>	<i>float</i> Step size scaling factor used to adjust Levy flights to length scale of system. The implementation of the Levy flight sampling makes this largely arbitrary.
<i>maxGens</i>	<i>integer</i> The maximum number of generations to search.
<i>maxFevals</i>	<i>integer</i> The maximum number of objective function evaluations.
<i>convTol</i>	<i>float</i> The minimum change of the best objective value before the search terminates.
<i>stallLimit</i>	<i>integer</i> The maximum number of generations to search without a decrease exceeding <code>convTol</code> .

<i>optConvTol</i>	<i>float</i> The maximum deviation from the best know fitness value before the search terminates.
<i>kwargs</i>	<i>ProblemParameters class arguments</i> Keyword arguments for the attributes of the ProblemParameters class. If not provided. The inhereted attributes will be set to the class defaults.

9.3.3 Member Function Documentation

9.3.3.1 def GnoweeHeuristics.GnoweeHeuristics.__repr__(self)

[GnoweeHeuristics](#) print function.

Parameters

<i>self</i>	<i>GnoweeHeuristics pointer</i> The GnoweeHeuristics pointer.
-------------	--

9.3.3.2 def GnoweeHeuristics.GnoweeHeuristics.__str__(self)

Human readable [GnoweeHeuristics](#) print function.

Parameters

<i>self</i>	<i>GnoweeHeuristics pointer</i> The GnoweeHeuristics pointer.
-------------	--

9.3.3.3 def GnoweeHeuristics.GnoweeHeuristics.cont_levy_flight(self, pop)

Generate new children using Levy flights permutation of current generation design parameters according to:

$$x_r^{g+1} = x_r^g + \frac{1}{\beta} L_{\alpha, \gamma},$$

where $L_{\alpha, \gamma}$ is calculated in [levy\(\)](#) according to the Mantegna algorithm. Applies [rejection_bounds\(\)](#) to ensure all solutions lie within the design space by adapting the step size to the size of the design space.

Parameters

<i>self</i>	<i>GnoweeHeuristic pointer</i> The GnoweeHeuristics pointer.
<i>pop</i>	<i>list of arrays</i> The current parent sets of design variables representing system designs for the population.

Returns

list of arrays: The proposed children sets of design variables representing the updated design parameters.
list: A list of the identities of the chosen index for each child.

9.3.3.4 def GnoweeHeuristics.GnoweeHeuristics.crossover(self, pop)

Generate new children using distance based crossover strategies on the top parent.

Ideas adapted from Walton "Modified Cuckoo Search: A New Gradient Free Optimisation Algorithm" and Storn "Differential Evolution - A Simple and Efficient Heuristic for Global Optimization over Continuous Spaces"

Parameters

<i>self</i>	<i>GnoweeHeuristic pointer</i> The GnoweeHeuristics pointer.
<i>pop</i>	<i>list of arrays</i> The current parent sets of design variables representing system designs for the population.

Returns

list of arrays: The proposed children sets of design variables representing the updated design parameters.
list: A list of the identities of the chosen index for each child.

9.3.3.5 def GnoweeHeuristics.GnoweeHeuristics.disc_levy_flight (*self*, *pop*)

Generate new children using truncated Levy flights permutation of current generation design parameters according to:

$$L_{\alpha,\gamma} = \text{FLOOR}(TLF_{\alpha,\gamma} * D(x)),$$

where $TLF_{\alpha,\gamma}$ is calculated in [tlf\(\)](#). Applies [rejection_bounds\(\)](#) to ensure all solutions lie within the design space by adapting the step size to the size of the design space.

Parameters

<i>self</i>	<i>GnoweeHeuristic pointer</i> The GnoweeHeuristics pointer.
<i>pop</i>	<i>list of arrays</i> The current parent sets of design variables representing system designs for the population.

Returns

list of arrays: The proposed children sets of design variables representing the updated design parameters.
list: A list of the identities of the chosen index for each child.

9.3.3.6 def GnoweeHeuristics.GnoweeHeuristics.elite_crossover (*self*, *pop*)

Generate new designs by using inver-over on combinatorial variables.

Adapted from ideas in Tao, "Iver-over Operator for the TSP."

Parameters

<i>self</i>	<i>GnoweeHeuristic pointer</i> The GnoweeHeuristics pointer.
<i>pop</i>	<i>list of arrays</i> The current parent sets of design variables representing system designs for the population.

Returns

list of arrays: The proposed children sets of design variables representing the updated design parameters.

9.3.3.7 `def GnoweeHeuristics.GnoweeHeuristics.initialize (self, numSamples, sampleMethod)`

Initialize the population according to the sampling method chosen.

Parameters

<i>self</i>	<i>GnoweeHeuristic pointer</i> The GnoweeHeuristics pointer.
<i>numSamples</i>	<i>integer</i> The number of samples to be generated.
<i>sampleMethod</i>	<i>string</i> The method used to sample the phase space and create the initial population. Valid options are 'random', 'nolh', 'nolh-rp', 'nolh-cdr', and 'lhc' as specified in <code>init_samples()</code> .

Returns

list of arrays: The initialized set of samples.

9.3.3.8 `def GnoweeHeuristics.GnoweeHeuristics.mutate (self, pop)`

Generate new children by adding a weighted difference between two population vectors to a third vector.

Ideas adapted from Storn, "Differential Evolution - A Simple and Efficient Heuristic for Global Optimization over Continuous Spaces" and Yang, "Nature Inspired Optimmmization Algorithms"

Parameters

<i>self</i>	<i>GnoweeHeuristic pointer</i> The GnoweeHeuristics pointer.
<i>pop</i>	<i>list of arrays</i> The current parent sets of design variables representing system designs for the population.

Returns

list of arrays: The proposed children sets of design variables representing the updated design parameters.

9.3.3.9 `def GnoweeHeuristics.GnoweeHeuristics.population_update (self, parents, children, timeline = None, genUpdate = 0, adoptedParents = [], mhFrac = 0.0, randomParents = False)`

Calculate fitness, apply constraints, if present, and update the population if the children are better than their parents.

Several optional inputs are available to modify this process. Refer to the input param documentation for more details.

Parameters

<i>parents</i>	<i>list of parent objects</i> The current parents representing system designs.
<i>children</i>	<i>list of arrays</i> The children design variables representing new system designs.

<i>timeline</i>	<i>list of history objects</i> The histories of the optimization process containing best design, fitness, generation, and function evaluations.
<i>genUpdate</i>	<i>integer</i> Indicator for how many generations to increment the counter by. Genenerally 0 or 1.
<i>adoptedParents</i>	<i>list</i> A list of alternative parents to compare the children against. This alternative parents are then held accountable for not being better than the children of others.
<i>mhFrac</i>	<i>float</i> The Metropolis-Hastings fraction. A fraction of the otherwise discarded parents will be evaluated for acceptance against the greater population.
<i>randomParents</i>	<i>boolean</i> If True, a random parent will be selected for comparison to the children. No one is safe.

Returns

list of parent objects: The current parents representing system designs.

integer: The number of replacements made.

list of history objects: If an initial timeline was provided, returns an updated history of the optimization process containing best design, fitness, generation, and function evaluations.

9.3.3.10 def GnoweeHeuristics.GnoweeHeuristics.scatter_search (self, pop)

Generate new designs using the scatter search heuristic according to:

$$x^{g+1} = c_1 + (c_2 - c_1)r$$

where

$$c_1 = x^e - d(1 + \alpha\beta)$$

$$c_2 = x^e - d(1 - \alpha\beta)$$

$$d = \frac{x^r - x^e}{2}$$

and

$$\alpha = 1 \text{ if } i < j \text{ \& -1 if } i > j$$

$$\beta = \frac{|j-i|-1}{b-2}$$

where b is the size of the population.

Adapted from ideas in Egea, "An evolutionary method for complex- process optimization."

Applies [simple_bounds\(\)](#) to ensure all solutions lie within the design space by adapting the step size to the size of the design space.

Parameters

<i>self</i>	<i>GnoweeHeuristic pointer</i> The GnoweeHeuristics pointer.
-------------	---

<i>pop</i>	<i>list of arrays</i> The current parent sets of design variables representing system designs for the population.
------------	--

Returns

list of arrays: The proposed children sets of design variables representing the updated design parameters.

list: A list of the identities of the chosen index for each child.

9.3.4 Member Data Documentation

9.3.4.1 GnoweeHeuristics.GnoweeHeuristics.alpha

float: Levy exponent - defines the index of the distribution and controls scale properties of the stochastic process.

9.3.4.2 GnoweeHeuristics.GnoweeHeuristics.convTol

float: The minimum change of the best objective value before the search terminates.

9.3.4.3 GnoweeHeuristics.GnoweeHeuristics.fracDiscovered

float: Discovery probability used for the [mutate\(\)](#) heuristic.

9.3.4.4 GnoweeHeuristics.GnoweeHeuristics.fracElite

float: Elite fraction probability used for the [scatter_search\(\)](#), [crossover\(\)](#), and [cont_crossover\(\)](#) heuristics.

9.3.4.5 GnoweeHeuristics.GnoweeHeuristics.fracLevy

float: Levy flight probability used for the [disc_levy_flight\(\)](#) and [cont_levy_flight\(\)](#) heuristics.

9.3.4.6 GnoweeHeuristics.GnoweeHeuristics.gamma

float: Gamma - scale unit of process for Levy flights.

9.3.4.7 GnoweeHeuristics.GnoweeHeuristics.initSampling

string: The method used to sample the phase space and create the initial population.

Valid options are 'random', 'nolh', 'nolh-rp', 'nolh-cdr', and 'lhc' as specified in [init_samples\(\)](#).

9.3.4.8 GnoweeHeuristics.GnoweeHeuristics.maxFevals

integer: The maximum number of objective function evaluations.

9.3.4.9 GnoweeHeuristics.GnoweeHeuristics.maxGens

integer: The maximum number of generations to search.

9.3.4.10 GnoweeHeuristics.GnoweeHeuristics.n

integer: Number of independent variables - can be used to reduce Levy flight sampling variance.

9.3.4.11 GnoweeHeuristics.GnoweeHeuristics.optConvTol

float: The maximum deviation from the best know fitness value before the search terminates.

9.3.4.12 GnoweeHeuristics.GnoweeHeuristics.penalty

float: Individual constraint violation penalty to add to objective function.

9.3.4.13 GnoweeHeuristics.GnoweeHeuristics.population

integer: The number of members in each generation.

9.3.4.14 GnoweeHeuristics.GnoweeHeuristics.scalingFactor

float: Step size scaling factor used to adjust Levy flights to length scale of system.

The implementation of the Levy flight sampling makes this largely arbitrary.

9.3.4.15 GnoweeHeuristics.GnoweeHeuristics.stallLimit

integer: The maximum number of gen3rations to search without a descrease exceeding convTol.

The documentation for this class was generated from the following file:

9.4 ObjectiveFunction.ObjectiveFunction Class Reference

The class creates a [ObjectiveFunction](#) object that can be used in optimization algorithms.

Inheritance diagram for ObjectiveFunction.ObjectiveFunction:

Public Member Functions

- `def __init__`
Constructor to build the [ObjectiveFunction](#) class.
- `def __repr__`
[ObjectiveFunction](#) class param print function.
- `def __str__`
Human readable [ObjectiveFunction](#) print function.
- `def set_obj_func`

- Converts an input string name for a function to a function handle.
- def [spring](#)
 - Spring objective function.
- def [mi_spring](#)
 - Spring objective function.
- def [welded_beam](#)
 - Welded Beam objective function.
- def [pressure_vessel](#)
 - Pressure vessel objective function.
- def [mi_pressure_vessel](#)
 - Mixed Integer Pressure vessel objective function.
- def [speed_reducer](#)
 - Speed reducer objective function.
- def [mi_chemical_process](#)
 - Chemical process design mixed integer problem.
- def [ackley](#)
 - Ackley Function: Multitmodal, n dimensional.
- def [shifted_ackley](#)
 - Ackley Function: Multitmodal, n dimensional Ackley Function that is shifted from the symmetric 0, 0, 0, ..., 0 optimum.
- def [dejong](#)
 - De Jong Function: Unimodal, n-dimensional.
- def [shifted_dejong](#)
 - De Jong Function: Unimodal, n-dimensional De Jong Function that is shifted from the symmetric 0, 0, 0, ..., 0 optimum.
- def [easom](#)
 - Easom Function: Multimodal, n-dimensional.
- def [shifted_easom](#)
 - Easom Function: Multimodal, n-dimensional Easom Function that is shifted from the symmetric pi, pi optimum.
- def [griewank](#)
 - Griewank Function: Multimodal, n-dimensional.
- def [shifted_griewank](#)
 - Griewank Function: Multimodal, n-dimensional Griewank Function that is shifted from the symmetric 0, 0, 0, ..., 0 optimum.
- def [rastrigin](#)
 - Rastrigin Function: Multimodal, n-dimensional.
- def [shifted_rastrigin](#)
 - Rastrigin Function: Multimodal, n-dimensional Rastrigin Function that is shifted from the symmetric 0, 0, 0, ..., 0 optimum.
- def [rosenbrock](#)
 - Rosenbrock Function: uni-modal, n-dimensional.
- def [shifted_rosenbrock](#)
 - Rosenbrock Function: uni-modal, n-dimensional Rosenbrock Function that is shifted from the symmetric 0,0,0...0 optimum.
- def [tsp](#)
 - Generic objective function to evaluate the TSP optimization by calculating total distance traveled.

Public Attributes

- [func](#)
 - function handle: The function handle for the objective function to be used for the optimization.
- [objective](#)
 - integer, float, or numpy array: The desired outcome of the optimization.

9.4.1 Detailed Description

The class creates a [ObjectiveFunction](#) object that can be used in optimization algorithms.

9.4.2 Constructor & Destructor Documentation

9.4.2.1 `def ObjectiveFunction.ObjectiveFunction.__init__(self, method=None, objective=None)`

Constructor to build the [ObjectiveFunction](#) class.

This class specifies the objective function to be used for a optimization process.

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>method</i>	<i>string</i> The name of the objective function to evaluate.
<i>objective</i>	<i>integer, float, or numpy array</i> The desired objective associated with the optimization. The chosen value and type must be compatible with the optimization function chosen. This is used in objective functions that involve a comparison against a desired outcome.

9.4.3 Member Function Documentation

9.4.3.1 `def ObjectiveFunction.ObjectiveFunction.__repr__(self)`

[ObjectiveFunction](#) class param print function.

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
-------------	--

9.4.3.2 `def ObjectiveFunction.ObjectiveFunction.__str__(self)`

Human readable [ObjectiveFunction](#) print function.

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
-------------	--

9.4.3.3 `def ObjectiveFunction.ObjectiveFunction.ackley(self, u)`

Ackley Function: Multimodal, n dimensional.

Optimal example:

$u = [0, 0, 0, 0, \dots, n-1]$

fitness = 0.0

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.4 def ObjectiveFunction.ObjectiveFunction.dejong (*self*, *u*)

De Jong Function: Unimodal, n-dimensional.

Optimal example:

$u = [0, 0, 0, 0, \dots, n-1]$

fitness = 0.0

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.5 def ObjectiveFunction.ObjectiveFunction.easom (*self*, *u*)

Easom Function: Multimodal, n-dimensional.

Optimal example:

$u = [\pi, \pi]$

fitness = 1.0

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
-------------	--

<i>u</i>	<i>array</i> The design parameters to be evaluated.
----------	--

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.6 def ObjectiveFunction.ObjectiveFunction.griewank (self, u)

Griewank Function: Multimodal, n-dimensional.

Optimal example:

$u = [0, 0, 0, \dots, 0]$

fitness = 0.0

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.7 def ObjectiveFunction.ObjectiveFunction.mi_chemical_process (self, u)

Chemical process design mixed integer problem.

Optimal example:

$u = [(0.2, 0.8, 1.907878, 1, 1, 0, 1)]$

fitness = 4.579582

Taken from: "An Improved PSO Algorithm for Solving Non-convex NLP/MINLP Problems with Equality Constraints"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated. [x1, x2, x3, y1, y2, y3, y4]

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.8 `def ObjectiveFunction.ObjectiveFunction.mi_pressure_vessel (self, u)`

Mixed Integer Pressure vessel objective function.

Near optimal example:

`u = [58.2298, 44.0291, 17, 9]`

`fitness = 7203.24`

Optimal example obtained with [Gnowee](#):

`u = [38.819876, 221.985576, 0.750000, 0.375000]`

`fitness = 5855.893191`

Taken from: "Nonlinear Integer and Discrete Programming in Mechanical Design Optimization"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.9 `def ObjectiveFunction.ObjectiveFunction.mi_spring (self, u)`

Spring objective function.

Optimal Example:

`u = [1.22304104, 9, 36] = [1.22304104, 9, 0.307]`

`fitness = 2.65856`

Taken from Lampinen, "Mixed Integer-Discrete-Continuous Optimization by Differential Evolution"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

float: The fitness associated with the specified input.

9.4.3.10 `def ObjectiveFunction.ObjectiveFunction.pressure_vessel (self, u)`

Pressure vessel objective function.

Near Optimal Example:

`u = [0.81250000001, 0.4375, 42.098445595854923, 176.6365958424394]`

fitness = 6059.714335

Optimal obtained using [Gnowee](#):

$u = [0.7781686880924992, 0.3846491857203429, 40.319621144688995, 199.99996630362293]$

fitness = 5885.33285347

Taken from: "Solving Engineering Optimization Problems with the Simple Constrained Particle Swarm Optimizer"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.11 def ObjectiveFunction.ObjectiveFunction.rastrigin (self, u)

Rastrigin Function: Multimodal, n-dimensional.

Optimal example:

$u = [0, 0, 0, \dots, 0]$

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i>

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.12 def ObjectiveFunction.ObjectiveFunction.rosenbrock (self, u)

Rosenbrock Function: uni-modal, n-dimensional.

Optimal example:

$u = [1, 1, 1, \dots, 1]$

fitness = 0.0

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i>

Returns

array: The fitness associated with the specified input.
array: The assessed value for each constraint for the specified input.

9.4.3.13 def ObjectiveFunction.ObjectiveFunction.set_obj_func (self, funcName)

Converts an input string name for a function to a function handle.

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>funcName</i>	<i>string</i> A string identifying the objective function to be used.

9.4.3.14 def ObjectiveFunction.ObjectiveFunction.shifted_ackley (self, u)

Ackley Function: Multimodal, n dimensional Ackley Function that is shifted from the symmetric 0, 0, 0, ..., 0 optimum.

Optimal example:

$u = [0, 1, 2, 3, \dots, n-1]$

fitness = 0.0

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.
array: The assessed value for each constraint for the specified input.

9.4.3.15 def ObjectiveFunction.ObjectiveFunction.shifted_dejong (self, u)

De Jong Function: Unimodal, n-dimensional De Jong Function that is shifted from the symmetric 0, 0, 0, ..., 0 optimum.

Optimal example:

$u = [0, 1, 2, 3, \dots, n-1]$

fitness = 0.0

Taken from: "Nature-Inspired Optimization Algorithms"

Taken from: "Solving Engineering Optimization Problems with the Simple Constrained Particle Swarm Optimizer"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.16 def ObjectiveFunction.ObjectiveFunction.shifted_easom (self, u)

Easom Function: Multimodal, n-dimensional Easom Function that is shifted from the symmetric pi, pi optimum.

Optimal example:

$u = [\pi, \pi+1]$

fitness = 1.0

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.17 def ObjectiveFunction.ObjectiveFunction.shifted_griewank (self, u)

Griewank Function: Multimodal, n-dimensional Griewank Function that is shifted from the symmetric 0, 0, 0, ..., 0 optimum.

Optimal example:

$u = [0, 1, 2, \dots, n-1]$

fitness = 0.0

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.18 def ObjectiveFunction.ObjectiveFunction.shifted_rastrigin (*self*, *u*)

Rastrigin Function: Multimodal, n-dimensional Rastrigin Function that is shifted from the symmetric 0, 0, 0, ..., 0 optimum.

Optimal example:

$u = [0, 1, 2, \dots, n-1]$

fitness = 0.0

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i>

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.19 def ObjectiveFunction.ObjectiveFunction.shifted_rosenbrock (*self*, *u*)

Rosenbrock Function: uni-modal, n-dimensional Rosenbrock Function that is shifted from the symmetric 0,0,0...0 optimum.

Optimal example:

$u = [1, 2, 3, \dots, n]$

fitness = 0.0

Taken from: "Nature-Inspired Optimization Algorithms"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
-------------	--

<i>u</i>	<i>array</i>
----------	--------------

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.20 def ObjectiveFunction.ObjectiveFunction.speed_reducer (self, u)

Speed reducer objective function.

Optimal example:

u = [58.2298, 44.0291, 17, 9]

fitness = 2996.34784914

Optimal example obtained with [Gnowee](#):

u = [3.500000, 0.7, 17, 7.300000, 7.800000, 3.350214, 5.286683]

fitness = 5855.893191

Taken from: "Solving Engineering Optimization Problems with the Simple Constrained Particle Swarm Optimizer"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.21 def ObjectiveFunction.ObjectiveFunction.spring (self, u)

Spring objective function.

Optimal Example:

u = [0.05169046, 0.356750, 11.287126]

fitness = 0.0126653101469

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.22 `def ObjectiveFunction.ObjectiveFunction.tsp (self, u)`

Generic objective function to evaluate the TSP optimization by calculating total distance traveled.

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i>

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.3.23 `def ObjectiveFunction.ObjectiveFunction.welded_beam (self, u)`

Welded Beam objective function.

Optimal Example:

`u = [0.20572965, 3.47048857, 9.0366249, 0.20572965]`

`fitness = 1.7248525603892848`

Taken from: "Solving Engineering Optimization Problems with the Simple Constrained Particle Swarm Optimizer"

Parameters

<i>self</i>	<i>pointer</i> The ObjectiveFunction pointer.
<i>u</i>	<i>array</i> The design parameters to be evaluated.

Returns

array: The fitness associated with the specified input.

array: The assessed value for each constraint for the specified input.

9.4.4 Member Data Documentation

9.4.4.1 `ObjectiveFunction.ObjectiveFunction.func`

function handle: The function handle for the objective function to be used for the optimization.

The function must be specified as a method of the class.

9.4.4.2 `ObjectiveFunction.ObjectiveFunction.objective`

integer, float, or numpy array: The desired outcome of the optimization.

The documentation for this class was generated from the following file:

- `/home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/ObjectiveFunction.py`

9.5 GnoweeUtilities.Parent Class Reference

The class contains all of the parameters pertinent to a member of the population.

Inheritance diagram for GnoweeUtilities.Parent:

Public Member Functions

- `def __init__`
Constructor to build the [Parent](#) class.
- `def __repr__`
[Parent](#) print function.
- `def __str__`
Human readable [Parent](#) print function.

Public Attributes

- [variables](#)
array: The set of variables representing a design solution.
- [fitness](#)
float: The assessed fitness for the current set of variables.
- [changeCount](#)
integer: The number of improvements to the current population member.
- [stallCount](#)
integer: he number of evaluations since the last improvement.

9.5.1 Detailed Description

The class contains all of the parameters pertinent to a member of the population.

9.5.2 Constructor & Destructor Documentation

9.5.2.1 `def GnoweeUtilities.Parent.__init__(self, variables=None, fitness=1E15, changeCount=0, stallCount=0)`

Constructor to build the [Parent](#) class.

Parameters

<i>self</i>	Parent pointer The Parent pointer.
-------------	---

<i>variables</i>	<i>array</i> The set of variables representing a design solution.
<i>fitness</i>	<i>float</i> The assessed fitness for the current set of variables.
<i>changeCount</i>	<i>integer</i> The number of improvements to the current population member.
<i>stallCount</i>	<i>integer</i> The number of evaluations since the last improvement.

9.5.3 Member Function Documentation

9.5.3.1 `def GnoweeUtilities.Parent.__repr__(self)`

[Parent](#) print function.

Parameters

<i>self</i>	Parent pointer The Parent pointer.
-------------	---

9.5.3.2 `def GnoweeUtilities.Parent.__str__(self)`

Human readable [Parent](#) print function.

Parameters

<i>self</i>	Parent pointer The Parent pointer.
-------------	---

9.5.4 Member Data Documentation

9.5.4.1 `GnoweeUtilities.Parent.changeCount`

integer: The number of improvements to the current population member.

9.5.4.2 `GnoweeUtilities.Parent.fitness`

float: The assessed fitness for the current set of variables.

9.5.4.3 `GnoweeUtilities.Parent.stallCount`

integer: he number of evaluations since the last improvement.

9.5.4.4 `GnoweeUtilities.Parent.variables`

array: The set of variables representing a design solution.

The documentation for this class was generated from the following file:

- `/home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/GnoweeUtilities.py`

9.6 GnoweeUtilities.ProblemParameters Class Reference

Creates an object containing key features of the chosen optimization problem.

Inheritance diagram for GnoweeUtilities.ProblemParameters:

Public Member Functions

- `def __init__`
Constructor for the *ProblemParameters* class.
- `def __repr__`
ProblemParameters class attribute print function.
- `def __str__`
Human readable *ProblemParameters* print function.
- `def sanitize_inputs`
Checks and cleans user inputs to be compatible with expectations from the *Gnowee* algorithm.
- `def set_preset_params`
Instantiates a *ProblemParameters* object and populations member variables from a set of predefined problem types.

Public Attributes

- `objective`
ObjectiveFunction Object: The objective function object to be used for the optimization.
- `constraints`
list of Constraint Objects: The constraints on the optimization design space.
- `lb`
Checks and cleans user inputs to be compatible with expectations from the *Gnowee* algorithm.
- `ub`
array: The upper bounds of the design variable(s).
- `varType`
array: The type of variable for each position in the upper and lower bounds array.
- `discreteVals`
array: $n \times m$ with $n = \#$ of discrete variables and $m = \#$ of values that can be taken for each variable.
- `optimum`
float: The global optimal solution.
- `pltTitle`
string: The title used for plotting the results of the optimization.
- `histTitle`
string: The plot title for the histogram of the optimization results.
- `varNames`

- list of strings: The names of the variables for the optimization problem.*
 - [cID](#)
array: The continuous variable truth array.
 - [iID](#)
array: The continuous variable truth array.
 - [dID](#)
array: The continuous variable truth array.
 - [xID](#)
array: The continuous variable truth array.

9.6.1 Detailed Description

Creates an object containing key features of the chosen optimization problem.

The methods provide a way of predefining problems for repeated use.

9.6.2 Constructor & Destructor Documentation

9.6.2.1 `def GnoweeUtilities.ProblemParameters.__init__(self, objective=None, constraints=[], lowerBounds=[], upperBounds=[], varType=[], discreteVals=[], optimum=0.0, pltTitle="", histTitle="", varNames=[""])`

Constructor for the [ProblemParameters](#) class.

The default constructor is useless for an optimization, but allows a placeholder class to be instantiated.

This class contains the problem definitions required for an optimization problem. It allows for single objective, multi-constraint mixed variable optimization and any subset thereof. At a minimum, the objective, lowerBounds, upperBounds, and varType attributes must be specified to run [Gnowee](#).

The optimum is used for convergence criteria and can be input if known. If not, the default (0.0) will suffice for most problems, or the user can make an educated guess based on their knowledge of the problem.

Parameters

<i>self</i>	<i>pointer</i> The ProblemParameters pointer.
<i>objective</i>	<i>ObjectiveFunction object</i> The optimization objective function to be used. Only a single objective function can be specified.
<i>constraints</i>	<i>list of Constraint objects</i> The constraints on the problem. Zero constraints can be specified as an empty list ([]), or multiple constraints can be specified as a list of Constraint objects.
<i>lowerBounds</i>	<i>array</i> The lower bounds of the design variable(s). Only enter the bounds for continuous and integer/binary variables. The order must match the order specified in varType and ub.

<i>upperBounds</i>	<i>array</i> The upper bounds of the design variable(s). Only enter the bounds for continuous and integer/binary variables. The order must match the order specified in varType and lb.
<i>varType</i>	<i>list or array</i> The type of variable for each position in the upper and lower bounds array. Discrete variables are to be included last as they are specified separately from the lb/ub through the discreteVals optional input. A variable can have two types (for example, 'dx' could denote a layer that can take multiple materials and be placed at multiple design locations). Allowed values: 'c' = continuous over a given range (range specified in lb & ub). 'i' = integer/binary (difference denoted by ub/lb). 'd' = discrete where the allowed values are given by the option discreteVals nxm array with n=# of discrete variables and m=# of values that can be taken for each variable. 'x' = combinatorial. All of the variables denoted by x are assumed to be "swappable" in combinatorial permutations. There must be at least two variables denoted as combinatorial. 'f' = fixed design variable. Will not be considered of any permutation.
<i>discreteVals</i>	<i>list of list(s)</i> nxm with n=# of discrete variables and m=# of values that can be taken for each variable. For example, if you had two variables representing the tickness and diameter of a cylinder that take standard values, the discreteVals could be specified as: discreteVals = [[0.125, 0.25, 0.375], [0.25, 0.5, 0.75]] Gnowee will then map the optimization results to these allowed values.
<i>optimum</i>	<i>float</i> The global optimal solution.
<i>pltTitle</i>	<i>string</i> The title used for plotting the results of the optimization.
<i>histTitle</i>	<i>string</i> The plot title for the histogram of the optimization results.
<i>varNames</i>	<i>list of strings</i> The names of the variables for the optimization problem.

9.6.3 Member Function Documentation

9.6.3.1 def GnoweeUtilities.ProblemParameters.__repr__(self)

[ProblemParameters](#) class attribute print function.

Parameters

<i>self</i>	<i>pointer</i> The ProblemParameters pointer.
-------------	--

9.6.3.2 def GnoweeUtilities.ProblemParameters.__str__(self)

Human readable [ProblemParameters](#) print function.

Parameters

<i>self</i>	<i>pointer</i> The ProblemParameters pointer.
-------------	--

9.6.3.3 `def GnoweeUtilities.ProblemParameters.sanitize_inputs (self)`

Checks and cleans user inputs to be compatible with expectations from the [Gnowee](#) algorithm.

Parameters

<i>self</i>	<i>pointer</i> The ProblemParameters pointer.
-------------	--

9.6.3.4 `def GnoweeUtilities.ProblemParameters.set_preset_params (self, funct, algorithm = "", dimension = 2)`

Instantiates a [ProblemParameters](#) object and populates member variables from a set of predefined problem types.

Parameters

<i>self</i>	<i>pointer</i> The ProblemParameters pointer.
<i>funct</i>	<i>string</i> Name of function being optimized.
<i>algorithm</i>	<i>string</i> Name of optimization program used.
<i>dimension</i>	<i>integer</i> Used to set the dimension for scalable problems.

9.6.4 Member Data Documentation

9.6.4.1 `def GnoweeUtilities.ProblemParameters.cID`

array: The continuous variable truth array.

This contains a one in the positions corresponding to continuous variables and 0 otherwise.

9.6.4.2 `GnoweeUtilities.ProblemParameters.constraints`

list of Constraint Objects: The constraints on the optimization design space.

9.6.4.3 `def GnoweeUtilities.ProblemParameters.dID`

array: The continuous variable truth array.

This contains a one in the positions corresponding to continuous variables and 0 otherwise.

9.6.4.4 GnoweeUtilities.ProblemParameters.discreteVals

array: nxm with n=# of discrete variables and m=# of values that can be taken for each variable.

9.6.4.5 GnoweeUtilities.ProblemParameters.histTitle

string: The plot title for the histogram of the optimization results.

9.6.4.6 def GnoweeUtilities.ProblemParameters.iID

array: The continuous variable truth array.

This contains a one in the positions corresponding to continuous variables and 0 otherwise.

9.6.4.7 GnoweeUtilities.ProblemParameters.lb

Checks and cleans user inputs to be compatible with expectations from the [Gnowee](#) algorithm.

array: The lower bounds of the design variable(s).

Parameters

<i>self</i>	<i>pointer</i> The ProblemParameters pointer.
-------------	--

9.6.4.8 GnoweeUtilities.ProblemParameters.objective

ObjectiveFunction Object: The objective function object to be used for the optimization.

9.6.4.9 GnoweeUtilities.ProblemParameters.optimum

float: The global optimal solution.

9.6.4.10 GnoweeUtilities.ProblemParameters.pltTitle

string: The title used for plotting the results of the optimization.

9.6.4.11 GnoweeUtilities.ProblemParameters.ub

array: The upper bounds of the design variable(s).

9.6.4.12 GnoweeUtilities.ProblemParameters.varNames

list of strings: The names of the variables for the optimization problem.

9.6.4.13 GnoweeUtilities.ProblemParameters.varType

array: The type of variable for each position in the upper and lower bounds array.

9.6.4.14 def GnoweeUtilities.ProblemParameters.xID

array: The continuous variable truth array.

This contains a one in the positions corresponding to continuous variables and 0 otherwise.

The documentation for this class was generated from the following file:

- /home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/[GnoweeUtilities.py](#)

9.7 GnoweeUtilities.Switch Class Reference

Creates a switch class object to switch between cases.

Inheritance diagram for GnoweeUtilities.Switch:

Public Member Functions

- def [__init__](#)
Creates a switch class object to switch between cases.
- def [__iter__](#)
Return the match method once, then stop.
- def [match](#)
Indicate whether or not to enter a case suite.

Public Attributes

- [value](#)
string: Case selector value.
- [fall](#)
boolean: Match indicator.

9.7.1 Detailed Description

Creates a switch class object to switch between cases.

9.7.2 Member Function Documentation

9.7.2.1 def GnoweeUtilities.Switch.__iter__ (self)

Return the match method once, then stop.

Parameters

<i>self</i>	<i>pointer</i> The Switch pointer.
-------------	---

9.7.2.2 def GnoweeUtilities.Switch.match (*self*, *args*)

Indicate whether or not to enter a case suite.

Parameters

<i>self</i>	<i>pointer</i> The Switch pointer.
<i>*args</i>	<i>list</i> List of comparisons.

Returns

boolean: Outcome of comparison match

9.7.3 Member Data Documentation

9.7.3.1 GnoweeUtilities.Switch.fall

boolean: Match indicator.

9.7.3.2 GnoweeUtilities.Switch.value

string: Case selector value.

The documentation for this class was generated from the following file:

- /home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/[GnoweeUtilities.py](#)

9.8 Sampling.WeightedRandomGenerator Class Reference

Defines a class of weights to be used to select based on linear weighting.

Inheritance diagram for Sampling.WeightedRandomGenerator:

Public Member Functions

- def [__init__](#)
[WeightedRandomGenerator](#) class constructor.
- def [next](#)

- Gets the next weight.*
 • `def __call__`
Gets the next weight.

Public Attributes

- `totals`**
list or numpy array: The ordinal ranking or data that is used to generate tehe weights.

9.8.1 Detailed Description

Defines a class of weights to be used to select based on linear weighting.

This can be on index or some form of ordinal ranking.

9.8.2 Constructor & Destructor Documentation

9.8.2.1 `def Sampling.WeightedRandomGenerator.__init__(self, weights)`

[WeightedRandomGenerator](#) class constructor.

Parameters

<i>self</i>	<i>pointer</i> The WeightedRandomGenerator pointer.
<i>weights</i>	<i>array</i> The array of weights (Higher = more likely to be selected)

9.8.3 Member Function Documentation

9.8.3.1 `def Sampling.WeightedRandomGenerator.__call__(self)`

Gets the next weight.

Parameters

<i>self</i>	<i>pointer</i> The WeightedRandomGenerator pointer.
-------------	--

Returns

integer: The randomly selected index of the weights array.

9.8.3.2 `def Sampling.WeightedRandomGenerator.next(self)`

Gets the next weight.

Parameters

<i>self</i>	<i>pointer</i> The WeightedRandomGenerator pointer.
-------------	--

Returns

integer: The randomly selected index of the weights array.

9.8.4 Member Data Documentation

9.8.4.1 Sampling.WeightedRandomGenerator.totals

list or numpy array: The ordinal ranking or data that is used to generate the weights.

The documentation for this class was generated from the following file:

- [/home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/Sampling.py](#)

Chapter 10

File Documentation

10.1 /home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/Constraints.py File Reference

Classes

- class [Constraints.Constraint](#)

The class creates a Constraints object that can be used in optimization algorithms.

10.2 /home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/Gnowee.py File Reference

Namespaces

- [Gnowee](#)

Contains the [Gnowee](#) optimization program and associated utilities.

Functions

- def [Gnowee.main](#)

Main controller program for the [Gnowee](#) optimization.

10.3 /home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/GnoweeHeuristics.py File Reference

Classes

- class [GnoweeHeuristics.GnoweeHeuristics](#)

The class is the foundation of the [Gnowee](#) optimization algorithm.

Namespaces

- [Gnowee](#)

Contains the [Gnowee](#) optimization program and associated utilities.

Functions

- def [GnoweeHeuristics.simple_bounds](#)
Application of problem boundaries to generated solutions.
- def [GnoweeHeuristics.rejection_bounds](#)
Application of problem boundaries to generated solutions.

10.4 /home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/GnoweeUtilities.py File Reference

Classes

- class [GnoweeUtilities.Parent](#)
The class contains all of the parameters pertinent to a member of the population.
- class [GnoweeUtilities.Event](#)
Represents a snapshot in the optimization process to be used for debugging, benchmarking, and user feedback.
- class [GnoweeUtilities.ProblemParameters](#)
Creates an object containing key features of the chosen optimization problem.
- class [GnoweeUtilities.Switch](#)
Creates a switch class object to switch between cases.

Namespaces

- [Gnowee](#)
Contains the [Gnowee](#) optimization program and associated utilities.

10.5 /home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/Objective-Function.py File Reference

Classes

- class [ObjectiveFunction.ObjectiveFunction](#)
The class creates a [ObjectiveFunction](#) object that can be used in optimization algorithms.

Namespaces

- [Gnowee](#)
Contains the [Gnowee](#) optimization program and associated utilities.

Functions

- def [ObjectiveFunction.prod](#)
Computes the product of a set of numbers (ie big PI, multiplicative equivalent to sum).

10.6 /home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/OptiPlot.py File Reference

Namespaces

- [Gnowee](#)

Contains the [Gnowee](#) optimization program and associated utilities.

Functions

- def [OptiPlot.plot_vars](#)
Plot the variables as they change in the optimization process.
- def [OptiPlot.plot_hist](#)
Plots the histogram of function evaluation results from multiple runs of an optimization algorithm.
- def [OptiPlot.plot_hist_comp](#)
Histograms and plots the comparison of two sets of function evaluation data.
- def [OptiPlot.plot_feval_hist](#)
Plots the fitness vs function evaluation results of an optimization algorithm run.
- def [OptiPlot.plot_tlf](#)
Plots a comparison of the TLF to the Levy distribution.
- def [OptiPlot.plot_optimization](#)
Plots the results of optimization process for a given algorithm and parameter.

10.7 /home/pyne-user/Dropbox/UCB/Research/ETAs/Design/Gnowee/src/Sampling.py File Reference

Classes

- class [Sampling.WeightedRandomGenerator](#)
Defines a class of weights to be used to select based on linear weighting.

Namespaces

- [Gnowee](#)

Contains the [Gnowee](#) optimization program and associated utilities.

Functions

- def [Sampling.initial_samples](#)
Generate a set of samples in a given phase space.
- def [Sampling.plot_samples](#)
Plot the first 2 and 3 dimensions on the sample distribution.
- def [Sampling.levy](#)
Sample the Levy distribution given by.
- def [Sampling.tlf](#)
Samples from a truncated Levy flight distribution (TLF) according to Manegna, "Stochastic Process with Ultraslow Convergence to a Gaussian: The Truncated Levy Flight" to map a levy distribution onto the interval [0,1].
- def [Sampling.NOLH](#)

This library allows to generate Nearly Orthogonal Latin Hypercubes (NOLH) according to Cioppa (2007) and De Rainville et al.

- def [Sampling.params](#)

Returns the NOLH order \$m\$, the required configuration length \$q\$ and the number of columns to remove to obtain the desired dimensionality.

- def [Sampling.get_cdr_permutations](#)

Generate a set of CDR permutations for NOLH.
